Introduction

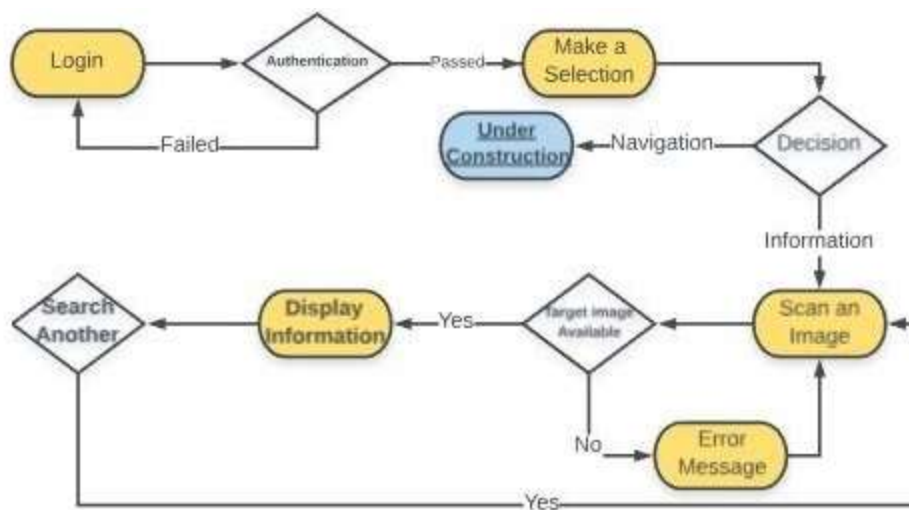

1.1 Scope Definition

Augmented Reality Based Framework is an augmented reality based application project that has the purpose of scanning the surroundings through a camera and projecting an image that can act as a guide cum virtual projection of the surrounding. We plan to implement these functionalities for an audience of Thapar university students and staff members.

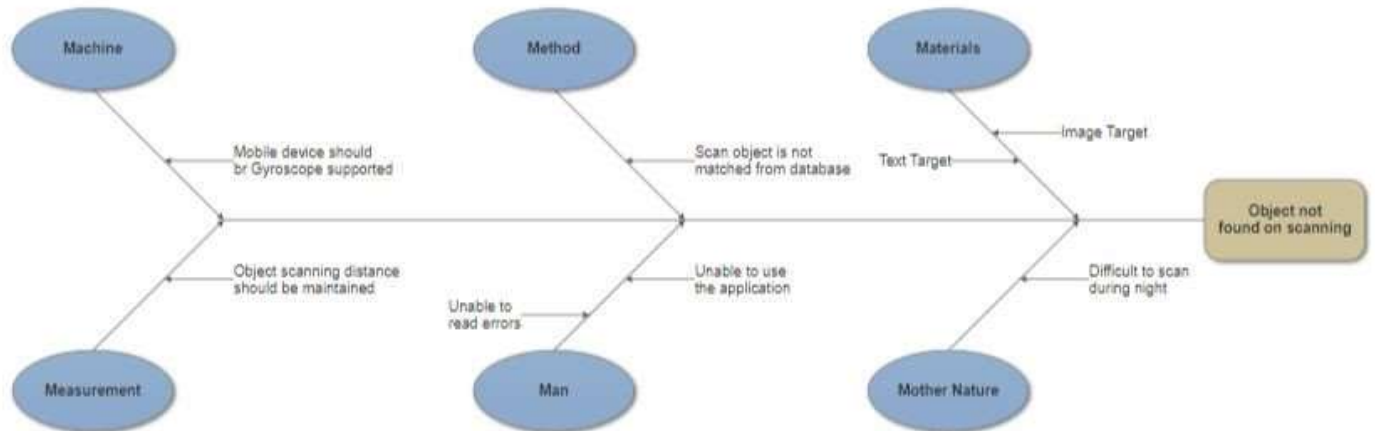

The AR Scanner System is to be implemented in the following three phases:

1. Pilot Phase: Here the AR scanner including access control will be implemented at the university level. Initially we will be providing access privileges for three types of users: Students, Staff and Admin as they will be ones most involved in this phase.
2. Institute wise deployment: Following the successful completion of the pilot phase, we plan to deploy the same across city and functionalities of AR Navigation and Art Draw will be implemented.
3. Extension of AR Scanner system to other applications: In the future we can have train our project using computer vision to give information about the objects scanned.
